Get location name from latitude and longitude in android. How to get current location latitude and longitude in android studio github. Get latitude and longitude in android kotlin. How to get city name from latitude and longitude in android. How to get current latitude and longitude in android without internet. Get address from latitude and longitude in android. Get current location latitude and longitude in android. Get latitude and longitude in android studio.

If you're viewing Apple Maps on your iPhone, iPad or Mac and want to know the latitude and longitude of a certain location, it's as easy as dropping a pin. Here's how it's done. How to Find Latitude and Longitude in Apple Maps on iPhone and iPad First, open Apple Maps on your iPhone or iPad. When viewing the map, place the map display in the region where you want to determine the latitude and longitude. It could be your current room or somewhere else. Place your finger on the screen exactly where you want to find latitude and longitude. After a while, a marker will drop on this spot. On iPad, as soon as you place a pin, you'll immediately see the latitude and longitude of that location in the Pinned Location window. On your iPhone, drag up the starred location window until you see the latitude and longitude. When you're done and want to remove a pin, tap the delete icon (which has a trash can on it). Or you can leave the pin in place and add more pins in other places. To find latitude and longitude in Apple Maps on Mac, open the Apple Maps app on your Mac. Place the map near the location whose latitude and longitude you want to determine. Click on the exact place with the mouse or touchpad and hold for a while until the marker falls on that place. Click on the Info button (it looks like a small letter "i" with a circle) in the pop-up window of the marked spot that appears next to the market marker. In the Tagged Location popup that appears, you'll find the latitude and longitude of that location just below the address. If you no longer need the pin, click the Remove PIN button in the pop-up window. Otherwise, click on the outside of the bubble to close it, then add more pins in other places if needed. Wherever you go, you are there. Stay organized with savings and collectionsIf you're viewing Apple Maps on your iPhone, iPad or Mac and want to find the latitude and longitude of a specific location, it's as easy as pinning a pin. That's how it's done. How to Find Latitude and Longitude in Apple Maps on iPhone and iPad First, open Apple Maps on your iPhone or iPad. When browsing the map, place the map view in the general area where you want to determine the latitude and longitude. It can be your current room or somewhere else. Place your finger on the screen exactly where you want to determine latitude and longitude. After some time, a pin will fall in this place. On iPad, when you release the pin, you'll immediately see the location's latitude and longitude in the Pinned Location window. On your iPhone, drag up the starred location window until you see the latitude and longitude. When you're done and want to remove a pin, tap the remove icon (with a trash can). Or you can leave the pin in place and add more pins in other places. Find latitude and longitude in Apple Maps on Mac Open Apple Maps on your Mac. Place the map near the location whose latitude and longitude you want to determine. Click the mouse or touchpad on the specific place and hold for a while until the mark falls on that place. In the highlighted area bubble that appears next to the market ticker, click the Info button (which looks like a small letter "i" with a circle). You can find the latitude and longitude of the location in the pantry bubble that shows the location directly below the address. If you no longer need the pin, click the Remove Pin button in the bubble window. Otherwise, click outside the bubble to close it, and add more pins in other places as needed. Wherever you go, there you are. Save a collection with Save a CollectionsContent according to your preferences. Android apps require an OAuth 2.0 client ID to use Google Fit for Android. All Android apps are signed with a digital certificate for which you have the private key. For more information on digital certificates, see the Android App Signing Guide. Android OAuth client IDs are associated with specific certificate/bundle pairs. Each certificate requires only one ID, regardless of the number of users of the application. There are several steps to get your App ID. These steps are described below. Find your app's certificate information. Create or modify a project in the Google API console. Request an OAuth 2.0 Client ID. An API key is based on a short form of your application's digital certificate, known as a SHA-1 fingerprint. To view a certificate's SHA-1 thumbprint, first verify that you are using the correct certificate. You can have two certificates: Debug Certificate: The Android SDK tools automatically generate this certificate during the debug build. Use this certificate only with the programs you are testing. Don't try to publish an app signed with a debug certificate. The debug certificate is described in more detail in the "Logging in debug mode" section of the Android developer documentation. Release Certificate: The Android SDK tools generate this certificate when creating a release. This certificate can also be created with the Keytool program. Use this certificate if you want to publish your application worldwide. Follow these steps to view the certificate's SHA-1 thumbprint using the keytool with the -v parameter. For more information about Keytool, see the Oracle documentation. Debug Certificate Locate the debug keystore file. The filename is debug.keystore and it is created when you first create a project. By default it is saved in the same directory as the Android Virtual Device (AVD) files: macOS and Linux: ~/.android/Windows Vista and 7: C:\Users\your_username\android\ View SHA-1 fingerprint: On Linux or macOS, open a terminal window and enter the following command: keytool -list -v -keystore ~/.android/debug.keystore -alias androiddebugkey -storepass android -keypass android On Windows Vista and Windows 7, run: keytool -list -v -keystore "%USERPROFILE%\android\debug.keystore" -alias androiddebugkey -storepass android -keypass android You should see an output similar to this: Alias: androiddebugkey Creation Date: Jan 1, 2013 Entry Type: PrivateKeyEntry Certificate Chain Length: 1 Certificate[1]: Owner: CN=Android Debug, O=Android, C=US Publisher: CN=Android Debug, O=Android C=US Serial Number: 4aa9b300 Valid From: Mon Jan 1 08:04:04 UTC 2013 To: Mon Jan 1 18:04:04 PST 2033 Certificate Thumbprints: MD5: AE:9F:95:D0:A6:86:89:BC:A8:70:BA:34:FF:6A:AC:F9 SHA1:BB:0D:AC:74:D3:21:E1:43:07:71:9B:62:90:AF:A1:66:6E:44:5D:75 name of signature algorithm: SHA1withRSA Version: 3 Issue certificate Find out your certificate icate key file. The version key store has no default location or name. If you don't specify it when building your app for release, the build leaves the APK file unsigned and you must sign it before it can be released. To issue a certificate, you also need the certificate alias and the keystore and certificate passwords. You can list aliases for all keys in the keystore by typing: keytool -list -keystore your_keystore_name Replace keystore_name with the full path and name of your keystore, including the .keystore extension. You will be prompted for the keystore password. The keytool then lists all aliases in the keystore. In a terminal or command prompt, type the following command: keytool -list -v -keystore yourkeystore_name -alias youralias Replace yourkeystore_name with the full path and name of your keystore, including the .keystore extension. Replace your alias name with the alias that was assigned to your certificate when it was created. You should see output similar to this: Alias name: Creation Date: 2013-02-02 Entry Type: PrivateKeyEntry Certificate String Length: 1 Certificate[1]: Owner: CN=Android Debug, O=Android, C=US Issuer: CN=Android Debug, O=Android, C=US Serial Number: 4cc9b300 Valid From: Mon Feb 2 08:01:04 UTC 2013 To: Mon Feb 2 18:05:04 PST 2033 Certificate Fingerprint: MD5 : AE: 9F :95:D0:A6:86:89:BC:A8:70:BA:34:FF:6B:AC:F9 SHA1: BB:0D:AC:74:D3:21:E1:43: 67 :71:9B:62:90:AF:A1:66:6E:44:5D:75 Signature Algorithm Name: SHA1withRSA Version: 3 The string starting with SHA1 contains the SHA-1 certificate thumbprint. A fingerprint is a sequence of 20 two-digit hexadecimal numbers separated by colons. Warning. To protect your keystore and key, do not enter the store access or key pass arguments on the command line unless you are sure that your computer is secure. For example, on a public computer, someone could view your terminal window history or list of running processes, obtain your password, and then gain write access to your signing certificate. This will allow that person to change or replace your app with their own. Request an OAuth 2.0 Client ID in the Google API Console Follow these steps to create or edit a project for your app in the Google API Console, enable the Fitness API, and request an OAuth 2.0 Client ID. Click Get Client ID to complete the process and automatically activate the Fitness API. Additionally, follow these steps to enable the Fitness API in the Google API Console and obtain an OAuth 2.0 client ID. Go to the Google API console. Select a project or create a new one. Use the same project for the Android and REST versions of your app. Click Continue to activate the Fitness API. Click Go to Credentials. Click "New Credentials" and then select "OAuth Client ID". Under Application type, select Android. In the dialog box that appears, enter the SHA-1 application fingerprint and package name. For instance.com.example.android.fit-example Click Create. Your new Android OAuth 2.0 client ID and secret will appear in the list of project IDs. The OAuth 2.0 client ID is a string like this: 780816631155-gbyvo1o7r2p95q64e9d611o4ub48hl.apps.googleusercontent.com Unless otherwise noted, the content on this page is licensed under the Creative.0 license, and the Creative.0 samples are licensed under the Apache 2.0 license. .
