I had the same problem with S905 when use defective usb flashing cable. and try redownload firmware I had same problem with M8S android box, through trial and error and an hour of pulling my hair out, I tried this, Amlogic burning tool, Toothpick method and male to male usb cable. (Leave toothpick in AV hole)After releasing the toothpick and pressing start the error comes up after 2% I quickly pressed the toothpick in again to see what would happen and boom it started to burn the firmware on, maybe luck i dont know but box back up running.. Hope it works for others..Des Same problem with MXIII 4k =(work for me... redownload firmware Code4power, a link please for download the img Had same issue with MXS Plus unit.... Tried a different USB-USB cable and now up and running. MANY THANKS TO ALL ON HERE I cannot get past that error. I have tried 3 different computers and various different versions of the burning tool as well as unchecking the boxes suggested above. So frustrating. x96pro + I cannot get past that error. I have tried 3 different computers and various different versions of the burning tool as well as unchecking the boxes suggested above. So frustrating. I had the same issues as described above, and I simly just changed the cable lenght from 1.5m to 30cm and the box started flashing itself from the burning tool! So guys after going crazy did this - Tried the Nand Method on a95x. Sequence - Upload your image to USB burning tool (don't hit start) - connect USB A to A cable (didn't connect) - Flash Pins 5-6 or 6-7 - Now USB tools see's the box but don't hit start yet - because usb power is not enough to burn it - Now insert the toothpic to hit the reset button - Now connect power while toothpic is inserted - Viola - the box starts burning - This is a sure to work method - everytime. So guys after going crazy did this - Tried the Nand Method on a95x. Sequence - Upload your image to USB burning tool (don't hit start) - connect USB A to A cable (didn't connect) - Flash Pins 5-6 or 6-7 - Now USB tools see's the box but don't hit start yet - because usb power is not enough to burn it - Now insert the toothpic to hit the reset button - Now connect power while toothpic is inserted - Viola - the box starts burning - This is a sure to work method - everytime. Dear, i tried this method as well...but no luck. please advice..., if possible please share the link for usb burning tool and the firmware for MXQ PRO+ model. Will try fresh. Would highly appreciate ur help... Had the same problem with mecool km9. Tried all with no luck, then i tried to disconnect the box, close then restart usb burning tool, load the img file, unchecked erase flash and erase bootloader, hold the reset button with toothpic, then connect the box, hit refresh, and after that, start the flashing process. So, if you tried to uncheck erase... like i did, you should try to disconnect the box, as it doesn't seem to register the unchecking without that. :good: You can see how many failed i had before disconnecting/reconnecting the box ! Reactions: juanelo321582, JustGameBV and seventhworl Page 2 Hi every body i had the same problem and after removing sdcard proble solved. just said my experience in case anybody needs help. good luck Usb Burning Tool error with scishion V88 pro I had not seen that this discussion was open and I posted elsewhere. I hope the administrators do not reproach me. I have two Scishion V88 pro boxes. On one I installed a custom rom that works great. On the other I wanted to test another ROM, but I didn't like it and I wanted to go back to the previous one using USB BURNING ROM. The problem is that the V88 pro does not have a reset button so I have to start the BURNING without reset. But I had already done it before and it had worked. Now I connect the V88 pro but the program does not recognize me; and the Amlogic symbol appears on the Android output screen and remains there. Does anyone own the same TV BOX? What other attempts can I make? Thank you ----- Post added at 04:50 PM ----- Previous post was at 04:45 PM ----- I had not seen that this discussion was open and I posted elsewhere. Now I connect the V88 pro but the program does not recognize me; and the Amlogic symbol appears on the Android output screen and remains there. Does anyone own the same TV BOX? What other attempts can I make? Thank you I solved my problem. I solved my problem; these were the usb burning tool drivers. I deleted the "libusb-win32 Usb Devices" drivers in device management; then I let them be loaded from the net. As soon as it was finished, the word "connected" appeared in the box of the usb burning tool window. I solved my problem; these were the usb burning tool drivers. I deleted the "libusb-win32 Usb Devices" drivers in device management; then I let them be loaded from the net. As soon as it was finished, the word "connected" appeared in the box of the usb burning tool window. Yes buddy it is usb driver error. in tool inside workcup device having a installusb driver.exe just click that installed driver and its working Error (0x10103003) Good evening! I need help. I have the error (0x10103003). USB cable A-A is working. I have tried other ROMs but the error persists. Can anyone help me with this problem? ----- -- Post added at 10:48 PM ----- Previous post was at 10:40 PM ----- I was unable to attach the image, so I'm going to host the OneDrive link. Last edited: Mar 29, 2020 x96 I have and I have the same problem now the tv box I connect the power supply and it turns on only red light did not open at all do you know what is happening now? I had also the following error when trying to flash Vorko Z6 using aml Burning tool: Romcode/Initialize DDR/Read initialize status/USB Control setup error Long story short: As there is absolutely no way to tell if you have a Vorko Z6 or a Vorko Z6 Plus visual look from outside on box I always tried to flash the wrong image. The seller sold it as Vorko Z6 (without "Plus", better version), so I tried to flash the Z6 plus image. After first successful flash of the wrong image the device bricked and wont boot up. Neither using toothpick method. So I had to open the device up, connect everything to my PC, raised volume of my Windows PC and went through the NAND connectors making shortcuts until I found the pins that I have to short in order to get the device into recovery mode. (USB Plug sound in windows). Then the device was also acknowledged by ams burning tool (device manager had a yellow exclamation mark saying error code 10 though, but it can be flashed). Always tried to flash w/o success having the above mentioned error. After a bit of rage (I destroyed the flimsy Wifi antenna) I randomly saw in a foreign non-understandable language video on youtube the PCB of the Vorko Z6 Plus and learned that my PCB is a Z6 Plus. Bummer! After downloading the correct firmware it flashed like a charme on first try, using cheapest USB Male-Male connector and a cheapest USB prolonging (extension) cable. So in my case even I was absolutely sure everything is correct I tried to flash the wrong image. If you encounter the same problem, you might want to check the PCB of your device and see if its inside whats written outside (fraud). cheers B In order to solve the errors, do I need to put password.bin file? And do I need to do do anything with the licence holder in drivers? how to use usb burning tool amlogic. how to install amlogic usb burning tool
